# Offender Management Architecture

For almost 20 years our biometric solutions have streamlined

identity-dependant processes  throughout the offender lifecycle

The Argus Offender Management Architecture can be leveraged to address a range of operational and security  challenges throughout the offender lifecycle, from secure access, visitor management, sensitive asset management, secure credentials, and prisoner movement to staff time and attendance recording.
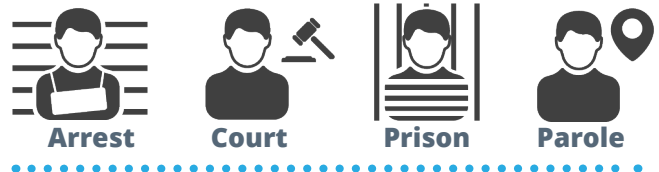

## Biometric identity management streamlining custodial processes

**Iris**  **Fingerprint**  **Finger Vein**

**Palm Vein**  **Facial**  **Voice**

Argus' TrueID's solution for the custodial market covers the end-to-end lifecycle of an offender through the various functional modules of system. Throughout the journey we manage and streamline a variety of operations, using biometric identification as the starting point, beginning from the time of arrest.

**Arrest**  **Court**  **Prison**  **Parole**

### Arrest & Court

Biometric information captured at the time of arrest is utilised throughout the offender's  journey. The solution streamlines a range of policing functions, including registered sex offender reporting, bail reporting and evidence tracking.

TrueID manages a variety of custodial operations starting with offender transport, where secure identification through biometrics can manage mustering and movement between locations. A complete audit trail is produced which is easily matched against barcoded inmate paperwork and routing instructions.

### Argus TrueID solutions manage:

**Mobile muster**  **Prisoner transport**

**Evidence tracking**  **Database sharing**

## Prison & Corrections

Once the offender arrives at the determined location, all their identification details are available to the processing officers via the server, so paperwork and process are minimised.

The TrueID framework seamlessly integrates with existing prison security, offender information and operations systems. Our unique software manages access control, tagged asset control, visitor management, prisoner movement control, mustering, drugs dispensing, secure credentials, and time & attendance.

A core benefit of Argus' technology is access and movement control of offenders in the prison. The software allows control of prisoner transport across facilities, movement between buildings, classes, visits and other rehabilitative programs, monitoring compliance and progress. This assists in tracking programs, managing costs and billing as well as program effectiveness.

### Argus TrueID solutions manage:

- Tagged asset management
- Staff time & attendance
- Visitor management
- Prisoner self-service kiosk
- Prisoner phones
- Prisoner money
- Drug dispensing
- Keysafe management

## Parole & Community Orders

When the offender is released, Argus' Biometric Offender Reporting and Information System (BORIS) manages reporting to community corrections. TrueID and BORIS integrate with various GPS tracking technologies to ensure that the offender complies with orders.

BORIS allows parolees to report as ordered by simply following the prompts on the self-service touchscreen kiosk where they are securely identified using biometric credentials, or if a departmental officer requires the person to be seen, an onscreen notice is provided.

BORIS significantly reduces manpower required for manual processing of offenders at parole centres and police stations.

### Argus TrueID solutions manage:

- Reporting kiosk
- GPS tracking
- Sex offender reporting
- Community orders
